EXECUTIVE SUMMARY: Project RootBeer Status

RootBeer is a project that solves the issues of apps hiding their access to root. It is largely maintained by two people.

Contributor Analysis

The project is currently sustained by a small group of specialized developers.

- **Lead Developer: (Scott Alexander-Bown)** Main developer and supporter of the project. They have been working on it since the start.
- **Key Support: (Matthew Rolling)** They were essential in helping Scott, however they have left in may of 2021.
- **Retention Risk:** The majority of contributors only contribute a few times before leaving entirely.
- **Reliant on one person** There is currently only one major contributor. We should invest in more.
- **Key Files** Only key source files from the list of provided languages were tracked. Many other files are either autogenerted or irrelevant.

Git Methodology

A short list of git commands used

- `git checkout`
- `git branch`
- `git commit`

Commit History: rootbeer

Contributor	Commits	Last Date
Scott Alexander	81 commits	2024-09-12
